Margarine & Butter Firmness by Penetration

TVT Texture Analyzer
The TVT Texture Analyzer (Figure 1) offers rapid and objective analysis for different products. The following parameters can be characterized for your product category:

- Firmness
- Cutting Force
- Consistency
- Stickiness

Both international standard methods as well as customer tailor-made profiles are available. 

Figure 1: TVT Texture Analyzer

Scope
- Determination of margarine & butter firmness by single cycle penetration test.

Method Description
The recording of the measurement data commences once the probe reaches the pre-set trigger force. The probe will then penetrate the sample to a pre-defined distance. After penetration, the probe returns to its starting position.

Calibration
Make sure the instrument is correct calibrated before the measurements. How to perform the calibration can be found in the User’s Manual.

Load cell (recommended)  5 -10 kg

Probe
Conical probe 45° angle, stainless steel (Figure 2)
Part number: 67.15.45

Figure 2: 67.15.45 (P-CO45)

<tr>
<td>Initial speed [mm/s]</td>
<td>3.0</td>
</tr>
<tr>
<td>Test speed [mm/s]</td>
<td>3.0</td>
</tr>
<tr>
<td>Retract speed [mm/s]</td>
<td>10.0</td>
</tr>
<tr>
<td>Trigger force [g]</td>
<td>5</td>
</tr>
<tr>
<td>Data rate [pps]</td>
<td>200</td>
</tr>
<tr>
<td>Adhesiveness</td>
<td>Marked</td>
</tr>
</tbody>
</table>

**Sample preparation**

Take the samples from their packaging just before testing and place under the probe, Figure 3. Work quickly, since the sample is sensitive for the surrounding temperature. If the same sample is used for several measurements, make sure that there is sufficient space between the penetration points. Storage, temperature and handling of the samples might influence the result and should thereby be kept constant.

**Curve Description**

In Figure 4 a typical Force-Distance curve is illustrated. Maximum peak’ force is here defined as the firmness of the sample, while the compression area is the total work of penetration (consistency). In this graph, not only the maximum firmness can be of interest but also the adhesiveness and stickiness.
Data Analysis
The force required to penetrate the sample to a certain distance is here defined as firmness and can be measured in the units [g] or [N]. Except raw data (force, time and distance) the program also directly provides calculated results such as mean value and standard deviation.
